                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Is used in the methods of the invention for treatment of cellulose-containing fibres, for bleaching denim-dyed cellulose-containing fibres, for eliminating flutfs from cellulose-containing fibres, for weight loss treatment of cellulose-containing fibres and of deacetylated triacetate rayon, all by contacting the preparation with such fibres. It is useful in the textile and related industries.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of ceilulase preparations comprising an endoglucanase with a ceilulose binding domain (CBD) and one or more terephthalic acid-alkylene glycol copolymer or terephthalic acid-oligoalkylene glycol copolymer. The glyco copolymer is of a formula given in the specification. The detergent compositions provide smooth removal of dirt. The detergent compositions of the invention are used for treatment of textiles for colour clarification, removal of feathers or improvement of texture to give a stone washed appearance. The present sequence represents a Trichoderma viride gene sequence, which is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                glycol

Cellulose-binding domain-lacking Zygomycetes-originated endoglucanase, with effect of endoglucanase activity enhanced in processing fibers, deinking waste paper and improving freeness of paper pulp
                                                                                                                                                             2002-471729/50.

The invention comprises the amino acid and coding sequences of zygomycetes-originated endoglucanase enzymes lacking the cellulose binding domain. The zygomycetes-originated endoglucanase enzymes of the invention have enhanced endoglucanase activity. The zygomycetes-originated endoglucanase enzymes of the invention are useful for processing fibres, de-inking waste paper and improving the freeness of paper pulp - which is particularly applicable in detergent compositions. The present DNA sequence represents an endoglucanase-related gene sequence of the invention.

                                                                                                                                      The invention relates to a cellulase preparation comprising a transconjugant-originated endoglucanase and a. non-ionic surfactant. The endoglucanase is selected from RCEI, RCEII, RCEII, MCEI, MCEII, MCEII proteins. The preparations are useful in detergent compositions, in treating cellulose fibers and deinking waste paper and improving the freeness of paper pulp. The fibers treated by the preparations have reduced feathering and improved skin-feel and appearance with colour clarification, local change in colour and softening, and after deinking and paper pulp treatment, there is an improvement on freeness of the paper pulp. This treatment with the cellulase preparation can be operated at significantly lower cost. The present sequence represents the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1590

                                                                                                                                                                                                                                                                 digestibility of the feed. The feed-additive enables a conventional cereal-based feed to by modified by reducing its energy, protein and/or amino acid content while simultaneously maintaining the same nutritional levels of energy, protein and amino acids available to the animal. The feed-additive also contains cellobiohydrolase, and optionally a xylanase, protease
                                                                                                                                                                                                                                                                                                                            Endoglucanase-II (EG-II) is used in an animal feed-additive to produce a cereal-based animal feed, especially for fowl. EG-II may be produced recombinantly, optionally without the cellulose-binding domain. The feed-additive can be incorporated into a cereal-based feed (barley, wheat, triticale, rye and maize) where it improves the conversion ratio and/or increases the digastibility of the feed.

The CBHI, CBHII, EGI and EGII enzymes have catalytic core domains useful for reducing dye redeposition (backstaining) cellulose-contg. fabrics such as denim, whilst maintaining or increasing abrasion during stonewashing. Truncated enzymes compritiese catalytic core domains can be obtd. by inserting the approparation of the second core domains can be obtd. by inserting the approparation that into a vector and using this to transform a Trichode sp. host cell.

                                                                                                                                                                                                                                                                                                  The present sequence represents an endoglucanase encoding gene. The invention relates to the gene and the protein encoded by it, having endoglucanase activity. Also included in the invention is an expression vector containing the gene sequence, and a fungus such as Aspergillus transformed by the expression vector. Endoglucanase is used to hydrolyse

The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTs are used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the gibtal expression of the same genes in one or more second filamentous fungal cells. Monitoring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               engineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot or array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results. AAF07478 to AAF11247 represents ESTs from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            discovered, possible functions of unknown open reading frames can be identified and gene copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                same genes in one or more second filame the global expression of genes from FF

                                                                                                                                                                                                                                                                                                                                                                                                                  are used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production potential of the microorganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be identified and gene copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway
                                                                                                                                                                                                                                                                                         niger; A

                                                                                                                                                                                                                                                                                                 engineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results. AAF07478 to AAF11247 represents ESTs from Fusarium venenatum; AAF11248 to AAF11853 represents ESTs from Aspergillus organe; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (Fr) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (NOVO)
                                                                                                                                                                                                                                      Sequence 584

clothes containing plant materials. Beta-glucanase polypeptide is useful for reducing the viscosity of a plant material, for cleaving beta-D-glucan polymers in the plant material, and for processing plant pulp, juice or extract, by incubating the pulp, juice or extract. Beta-glucanase polypeptide is applicable in brewing, distilling, blomerhanation, dental hygiene, leather-treatment, paper manufacture, textile treatment or manufacture, baking or bread making, washing or detergent treatment, treating flower bulbs or in animal feed.

Beta-glucanase polypeptide is also useful during the production of milk substituted from soybean. The present sequence is Talaromyces emersonii beta-glucanase form soybean.
                                                                                                                                                                                                                                             The invention relates to a beta-glucanase polypeptide obtainable from fungus of the genus Talaromyces, e.g. T.emersonii, having endoglucanas activity (EC 3.2.1.4). Beta-glucanase polypeptide is useful for the manufacture of a medicament for treating hyperlipaemia, high serum cholesterol and triglyceride levels. Beta-glucanase polypeptide are
                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide for treating hyperlipemia and/or high serum cholesterol and triglyceride levels, comprises the beta-glucanase protein obtainable from Talaromyces fungus -

```
cc genomic sample of DNA. The sample is treated chemically to convert cc cytosine (C) but not methylated C, to uracil, then part of the genomic CDNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one commender, of oligonuclectides and/or peptide-nucletic acid (PNA) oligoners and the degree of hybridisation to both classes is determined from the clabel on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method cc is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory csystems etc., particularly by detecting mutations or single nucleotide colymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABO13410-ABO44121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the contraction of the invention.

                                                                                                                                                                                                                         systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (il) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in
                                                                                                                                                                                                                                                                                                                                               label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Olek A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-SEP-2000; 2000DE-1043826.
